Individual Research: Data Processing And Preparation

In my research into data processing I was able to learn that there are many variables that come into play. NLPs do need relevant and easy to read data to learn from. So, to start you would need a web scraper like Scrapy, then that data would have to be further normalized and tokenized.

**Method for acquiring the material to be analyzed:** Scrapy - Python, useful for large-scale web scraping

**Useful links on NLP models:**
