

//// @home-page ////

---

Hello and welcome to a brief tutorial on the J-Initiative web scraping and data analysis tool!

This tool was developed to allow for the user to see analysis of discussion around drug-use, drug users and possibly other health issues that have gained a negative connotation due to the diction chosen when discussing the topic on social media, in the news, and in general across the board from general people, politicians and celebrities.

Seeing data on what words are used and where can help health professionals and non-profits to come up with plans to help counter these narratives in order to give better help to those suffering from drug addiction.

Our program uses an NLP model in order to analyze data, and also allows the user to, should they wish, give the NLP more data to analyze by choosing the data themselves.

This tutorial will quickly run through the app and its sections in order to show a new user how to use the application and what each of its sections are for!

First of all, welcome to the program!

This tutorial should be accurate still, but there may be minor differences in your version, depending on when you are watching this.

With that said, you should still start off here, on the home page!

On opening, this is the first page you will see.

When you first open, you may see this section of the page—which many of you may recognize as an inspect element page!

This is available so that you can see information about the app and its functionings as it is running, and you can just close it if you don't need to use it right now.

*\*close inspect element\**

Now, the home page is the one that the user is started on, and may have some information for you if that information is available.

*\*move to\**

//// @home-page:notifications-added ////

For example, you may receive a notification on important information involving the app and issues it may have run across.

These shouldn't be too common, but depending on what notifications you receive, they may be very important, so make sure you keep an eye out for them!

For the demonstration, I added some notifications that would not normally be given during running of the program, just to show how they will look.

To open them, just click on the notification badge, and then you can see any notifications by clicking on the notification itself.

You can dismiss any notifications by clicking dismiss, and can go back without dismissing if you would like to by clicking the x button.

Of course, you can then go back to the notifications again and dismiss any of the notifications that you would like to.

Now, while I was talking about all of that you may have noticed that my program may look different from yours.

Namely, that it is in dark mode, while yours may not be.

Regardless of what theme you are in or what theme you would like to have, it is easy to change to your desire by simply selecting this theme button and choosing what you would like to have!

As of right now you can choose from light mode, dark mode, blue mode and disco mode!

To select the theme, just click it, and know that you can easily change the theme again by just doing the same thing.

This theme should also persist across sessions—which is to say that your theme preference will be the selected theme on the application launch until you change it!

//// @scrape-page ////

Next, we have the scrape page, where you are able to enter a url into this box and click submit.

On clicking that submit button, a new window will open up with that website in a little menu.

You can, from here, look at the formatted or raw data from the website, as well as port it into a label studio project to label it all, if you have a label studio project loaded into the J-Initiative application.

\*move to\*

//// @scrape-page:manual-mode ////

Additionally, if you would like to select what in particular on the page you would like to scrape, and what specific label studio project to export it to, you can click this manual mode button in order to decide on all of those things and give you, the user, more power.

*\*move to\**

//// @annotation-page ////

Next, the annotation page allows the user to enter their label studio project url in order to link it into the application and manipulate scraped data.

This is how you will label scraped data and allow it to be fed to the NLP model should you wish to expand its abilities from what it comes with.

*\*move to\**

//// @database-page ////

Scraped data is also stored in a database, either locally, or, if the user would like to do so, in a longer lasting storage where the data is available to look at, and will continue to be used by the NLP for training purposes.

This page is where you can see and interact with the database and its information.

*\*move to\**

//// @about-page ////

This is the about page, which just contains some simple information on the application.

\*move to\*

//// @logs-page ////

---

Finally, this is the logs page, where you can see logs on goings on of the application, as well as information about what did and didn't load.

Should you come across any issues while using the application, this page can be very useful.

With all of those pages, you will be ready to interact with the NLP model as you wish—just go to the NLP model and you should be able to see the data and analysis it did on all of the information that you provided!

With that, hopefully you have a pretty good idea of what the app does and the basics of how to use it!

I hope that the application is able to help you out in your journey to help the world be a better place!
