

//// @home-page ////

Hello and welcome to a brief tutorial on the J-Initiative web scraping and data analysis tool!

This tool helps its users by providing analysis on discussions being held about drug-use and drug users, specifically focusing on words that signify a negative connotation when discussing the topic on social media, in the news, and in general across the board.

Seeing data on word choice involving important health topics can help healthcare professionals and non-profits come up with plans to help counter negative narratives that arise and ensure better help is given to those suffering from drug addiction.

Our program uses an NLP model in order to analyze data, and also lets the user give the NLP more data to analyze through its web scraping features.

This tutorial will quickly run through the web scraping app and its sections for any new users so that you can get right into using the application!

—

First of all, welcome to the program!

To start off, on launch you should be here, on the home page!

When you first open the program, you may see this section of the page—which many of you may recognize as an inspect element page!

This is available so that you can see information about the app and what is going on as it is running, but you can just close it if you don't need to use it right now.

close inspect element

Now, beyond being the page the user is started on, the home-page may also have some important information for you.

move to

//// @home-page:notifications-added ///

For example, you may receive a notification on need-to-know information involving the app and issues it may have run across.

These shouldn't be too common, but depending on what notifications you receive, they may be very important, so make sure you keep an eye out for them!

For the demonstration, I added some notifications that would not normally be given during running of the program, just to show how they will look.

To open your notifications, just click on the notification badge.

To then see other notifications just click on the notification itself, opening a drop-down menu with everything else.

You can dismiss any notifications by clicking dismiss, and can go back without dismissing a notification if you would like to by clicking the x button.

Of course, you can then go back to the notifications again and dismiss any of the notifications should you wish to.

Now, while we have been going through the program you may have noticed that my program looks different from yours.

Namely, my program is in dark mode, while yours likely will not be.

Regardless of what theme you are in or what theme you would like to have, it is easy to change at any time by simply selecting this theme button and choosing what you would like to have!

click theme button

As of right now you can choose from light mode, dark mode, blue mode and disco mode!

To select the theme, just click it, and know that you can easily change the theme again by just doing the same thing.

change to light, then back to dark mode

This theme should also persist across sessions—which is to say that your theme preference will be the selected theme on the application launch until you change it!

move to

//// @scrape-page ////
—————

Next, we have the scrape page, where you are able to enter a url into this box and click submit.

On clicking that submit button, a new window will open up with that website in a little menu.

Doing this will also scrape data from the website!

As such, from here you can look at the formatted or raw data from the website, as well as port it into a label studio project to label all of your data—should you already have a label studio project loaded into the J-Initiative application.

move to

//// @scrape-page:manual-mode ////

Additionally, if you would like to have more control over what in a page is scraped, and have more control over what label studio project the scraped data is exported to, you can click this manual mode button in order to customize each of those things.

move to

//// @annotation-page ////

Next, the annotation page allows the user to enter their label studio project url in order to link it into the application and manipulate scraped data.

This is how you will label scraped data and allow it to be fed to the NLP model should you wish to expand its abilities from what information it comes with.

move to

//// @database-page ////

Scraped data is also stored in a database, either locally, or, if the user would like to do so, in a longer lasting storage where the data is available to look at, and will continue to be used by the NLP for training purposes.

This page is where you can see and interact with the database and its information once it exists.

move to

//// @about-page ///

This is the about page, which just contains some basic information about the application.

move to

//// @logs-page ///

Finally, this is the logs page, where you can see information on the goings on of the application, as well as about what did and didn't load.

Should you come across any issues while using the application, this page can be very helpful, so keep it in mind!

With all of those pages out of the way, you will be ready to interact with the NLP model whenever you wish to!

Just go to the NLP model and you should be able to see the data and analysis it did on all of the information that you provided!

With that, hopefully you have a pretty good idea of what the app does and the basics of how to use it!

I hope that the application is able to help you out in your journey to help the world be a better place!
