Embedded tutorial video deliberation

- As mentioned by Dan, there is a real chance that a new user would decide against going through a real, hands on tutorial, and would be more primed towards a video tutorial
- Even if they did go through it, it feels likely that the user would pay more attention to the video than the hands-on tutorial (though this is just based on how I feel about it)
- The video will involve less moving parts, less additional variables, less methods to initialize—in general, it will just be sleeker, more efficient, safer and pare down the program
- To embed the video, a new page could be added to the program, and that page could be embedded into the home page (to avoid issues with the security policy)
- That new page would hold the video (which itself would likely be simply uploaded to YouTube)
- The video would go through each section of the program. It would also have example notifications, information on design (eg. light mode, dark mode, etc), and more
- While the option to watch the tutorial should only pop up when the localStorage indicates that they had never been given the prompt before, it may make sense to have some way to access the tutorial again if the user so wishes (maybe a setting or something?)
- The rest of the document will be dedicated to research into the implementation of the embedded video itself
